**BIHETEROARYL-CARBONYL AND CARBOXAMIDE DERIVATIVES WITH

This invention relates to compounds having pharmacological activity, to a process for their preparation, to compositions containing them and to their use in the treatment of mammals.

WO 95/01976 (SmithKline Beecham plc) describes indoline derivatives which are described as possessing 5HT<sub>2C</sub> receptor antagonist activity. A structurally distinct class of compounds has now been discovered, which have been found to have 5HT<sub>2C</sub> receptor antagonist activity. 15 The compounds of the formula (I) can form acid addition salts with acids, such as conventional pharmaceutically acceptable acids, for example maleic, hydrochloric, hydrobromic, phosphoric, acetic, fumaric, salicylic, citric, lactic, mandelic, tartaric and methanesulphonic.

20 The present invention also provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt thereof, which process comprises the coupling of a compound of formula (II):

20

25

wherein A, B, C, and D are as defined in formula (I), E is as defined in formula (I) or is a group NR<sup>1</sup>, L is a leaving group and X is hydrogen or a metal atom, and the variables, 30 R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> respectively, as defined in formula (I), or groups convertible thereto, and thereafter optionally and as necessary and in any appropriate order, converting any R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> when other than R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> respectively to R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup>, interconverting R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> and forming a pharmaceutically acceptable salt thereof.

Suitably L is a leaving group such as halogen, in particular chloro.

Suitably X is hydrogen or a metal atom such as lithium or magnesium.

Interconversion of a compound of formula (I) into another compound of formula (I) is carried out by conventional procedures well known in the art.

5 For example, in the case wherein R<sup>1</sup> is hydrogen, it is possible to introduce a C<sub>1</sub>-C<sub>6</sub>alkyl group by conventional alkylation using 1 molar equivalent of a C<sub>1</sub>-C<sub>6</sub>alkyl halide and 1 molar equivalent of a suitable base in an inert solvent.

10 It should be appreciated that it may be necessary to protect certain reactive groups during coupling reaction (a) above. Suitable protecting groups and methods for their attachment and removal are conventional in the art of organic chemistry, such as those described in Greene T.W. 'Protective groups in organic synthesis' New York, Wiley (1981).

Compounds of formula (II) are known compounds or can be prepared from compounds of formula (IV):

in which R<sup>2</sup>, A, B, C, D and E are as defined in formula (II) using standard procedures.

Compounds of formula (III) can be prepared according to the procedures outlined in WO 95/01976. Compounds of formula (IV) are commercially available or 20 can be prepared using standard procedures.

Pharmaceutically acceptable salts may be prepared conventionally by reaction with the appropriate acid or acid derivative.

Compounds of formula (I) and their pharmaceutically acceptable salts have 25 SHT<sub>2B/2C</sub> receptor antagonist activity and are believed to be of potential use for the treatment or prophylaxis of CNS disorders such as anxiety, depression, epilepsy, obsessive compulsive disorders, migraine, Alzheimers disease, sleep disorders, feeding disorders such as anorexia and bulimia, panic attacks, withdrawal from drug abuse such as cocaine, ethanol, nicotine and benzodiazepines, schizophrenia, and also disorders associated with spinal trauma and/or head injury such as hydrocephalus. Compounds of 30 the invention are also expected to be of use in the treatment of certain GI disorders such as IBS as well as microvascular diseases such as macular oedema and retinopathy.

Thus the invention also provides a compound of formula (I) or a pharmaceutically acceptable salt thereof, for use as a therapeutic substance, in particular in the treatment or prophylaxis of the above disorders.

The invention further provides a method of treatment or prophylaxis of the above disorders, which comprises administering to the sufferer a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt thereof.

5 In another aspect, the invention provides the use of a compound of formula (I) or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for the treatment or prophylaxis the above disorders.

The present invention also provides a pharmaceutical composition, which comprises a compound of formula (I) or a pharmaceutically acceptable salt thereof, and a pharmaceutically acceptable carrier.

10 A pharmaceutical composition of the invention, which may be prepared by admixture, suitably at ambient temperature and atmospheric pressure, is usually adapted for oral, parenteral or rectal administration and, as such, may be in the form of tablets, capsules, oral liquid preparations, powders, granules, lozenges, reconstitutable powders, injectable or infusible solutions or suspensions or suppositories. Orally administrable 15 compositions are generally preferred.

Tablets and capsules for oral administration may be in unit dose form, and may contain conventional excipients, such as binding agents, fillers, tabletting lubricants, disintegrants and acceptable wetting agents. The tablets may be coated according to methods well known in normal pharmaceutical practice.

20 Oral liquid preparations may be in the form of, for example, aqueous or oily suspension, solutions, emulsions, syrups or elixirs, or may be in the form of a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, emulsifying agents, non-aqueous vehicles (which may include edible oils), preservatives, and, if 25 desired, conventional flavourings or colorants.

For parenteral administration, fluid unit dosage forms are prepared utilising a compound of the invention or pharmaceutically acceptable salt thereof and a sterile vehicle. The compound, depending on the vehicle and concentration used, can be either suspended or dissolved in the vehicle. In preparing solutions, the compound can be 30 dissolved for injection and filter sterilised before filling into a suitable vial or ampoule and sealing. Advantageously, adjuvants such as a local anaesthetic, preservatives and buffering agents are dissolved in the vehicle. To enhance the stability, the composition can be frozen after filling into the vial and the water removed under vacuum. Parenteral suspensions are prepared in substantially the same manner, except that the compound is 35 suspended in the vehicle instead of being dissolved, and sterilisation cannot be accomplished by filtration. The compound can be sterilised by exposure to ethylene

oxide before suspension in a sterile vehicle. Advantageously, a surfactant or wetting agent is included in the composition to facilitate uniform distribution of the compound.

The composition may contain from 0.1% to 99% by weight, preferably from 10 to 60% by weight, of the active material, depending on the method of administration.

5 The dose of the compound used in the treatment of the aforementioned disorders will vary in the usual way with the seriousness of the disorders, the weight of the sufferer, and other similar factors. However, as a general guide suitable unit doses may be 0.05 to 1000 mg, more suitably 0.05 to 20.0 mg, for example 0.2 to 5 mg; and such unit doses may be administered more than once a day, for example two or three a day, so 10 that the total daily dosage is in the range of about 0.01 to 100 mg; and such therapy may extend for a number of weeks or months.

The following Examples illustrate the preparation of compounds of the invention.
